- Deep inelastic scattering (experimental)
- Quark model (theoretic)
- Symmetries in the quark model (theoretic)
- Hadronization (experimental)

1) Deep inelastic scattering

1.1) Probing the structure of the proton

We define $Q^2 = -q^2 > 0$ for t -channel processes

photon wavelength $\lambda \approx \frac{1}{\sqrt{Q^2}}$

1.2) Inelastic scattering at low Q^2

scattering when the final state contains excited states

for example $e^- p \rightarrow e^- \Delta^+ \rightarrow e^- p \pi^0$

1.3) Deep inelastic scattering

the γ interacts with one constituent of the proton
